

Data sheet

Solenoid valves

Type EVU for fluorinated refrigerants

EVU solenoid valves are designed to fit into compact refrigeration systems. Available in direct and servo operated versions, they can be applied in liquid, suction, and hot gas lines with fluorinated refrigerants.

EVU solenoid valves can be used in many different refrigeration systems and are specially designed for:

- commercial refrigeration systems
- refrigeration appliances
- liquid coolers
- ice cube machines
- mobile refrigeration systems
- heat pump systems
- air conditioning units

EVU valves are available in straightway or angleway design. All valves are semi hermetically sealed and are not serviceable. The standard coil is available with 3-core cable connection, DIN plug and 0.25 US spade.

EVU valve bodies and coils are ordered separately.

Features

- Compact construction small dimensions, low weight for both valve and coil.
- Semi-hermetic construction. Metallic sealing between armature tube and valve body. Bimetal connections to the brass housing Benefits:
 - high strength of joints and high vibration resistance
 - maximum external tightness within the whole temperature and pressure operation range
- Bimetal connections simple, fast soldering without the need of wet cloth or refrigeration pliers.
- Direct and servo operated mini piston compact solenoid valve.
- Universal application for
 - liquid, suction, and hot gas applications
 - reduced power consumption
- Simple and fast mounting of coil
 - clip - ON / OFF
- Small encapsulated coils with long life time under extreme conditions.
- Refrigerants: R744, R22 / R407C, R404A / R507, R410A, R134a, R407A, R23. For other refrigerants, please contact Danfoss.
- Large MOPD range – up to 36 bar.

Approvals

- UL Recognized Component (Canadian and US)
- Pressure Equipment Directive (PED) 2014/68/EU
- Low Voltage Directive (LVD) 2014/35/EU

Technical data
Refrigerants

R744, R22 / R407C, R404A / R507, R410A, R134a, R407A, R23.

For other refrigerants, please contact Danfoss.

Temperature of medium

-40 – 221 °F

Ambient temperature

-40 – 140 °F

MOPD operating range

0.029 psi up to 522 psi

Humidity

0 – 100% R.H. (0-97% R.H. non-condensation condition if IP level is below IPX5).

Type	Opening differential pressure with standard coil Δp [psi]		Temperature of medium [°F]	Max. working pressure [psi]	C_v – value ¹⁾ [gal / min]
	Min.	Max. (=MOPD) liquid ²⁾			
			8 W AC		
EVU 1	0.000	348 ³⁾	-40 – 221	1015	0.11
EVU 2	0.029	522	-40 – 221	1015	0.23
EVU 3	0.029	522	-40 – 221	1015	0.35
EVU 4	0.029	522	-40 – 221	1015	0.58
EVU 5	0.029	522	-40 – 221	1015	0.76
EVU 6	0.029	522	-40 – 221	1015	0.93
EVU 8	0.029	522	-40 – 221	1015	1.15

¹⁾ C_v value is the water flow in [gal / min] at a pressure drop across valve $\Delta p = 1$ psi, $\rho = 10$ lbs / gal

²⁾ MOPD for media in gas form is approximately 14 psi greater

³⁾ For coil 208 – 240 V, 60 Hz, MOPD is 250 psi

MOPD (Max. Opening Pressure Differential) is measured with highest media and ambient temperature and 15% below nominal voltage

¹⁾ Rated liquid and suction vapor capacity are based on:

- evaporating temperature $t_e = 40$ °F
- liquid temperature ahead of valve $t_l = 100$ °F
- pressure drop Δp across valve
 - with liquid $\Delta p = 2$ psi for R134a, $\Delta p = 3$ psi for R22 / R407C, R404A and R507
 - with suction vapor $\Delta p = 1$ psi

Rated hot gas capacity is based on:

- condensing temperature $t_c = 100$ °F
- hot gas temperature $t_h = 140$ °F
- pressure drop across valve $\Delta p = 2$ psi

Metric conversions:

- 1 psi = 0.07 bar
- $^5/9 (t_1 \text{ °F} - 32) = 12 \text{ °C}$
- 1 TR = 3.5 Kw
- 1 in = 25.4 mm
- 1 ft = 0.3 m
- 1 lb = 0.454 kg
- 1 oz = 28.35 gram
- US gal / min = 0.86 m³ / h

Metric conversions

- 1 psi = 0.07 bar
- $\frac{5}{9} (t_1 \text{ °F} - 32) = t_2 \text{ °C}$
- 1 TR = 3.5 kW

Capacities are based on:
 - liquid temperature $t_l = 100 \text{ °F}$,
 - evaporating temperature $t_e = 40 \text{ °F}$,
 - superheat temperature $(t_e + 10 \text{ °F}) = 50 \text{ °F}$.

Correction factors for liquid temperature t_l

t_l [°F]	80	90	100	110	120
Factor	1.10	1.05	1.00	0.95	0.90

When liquid temperature t_l ahead of the expansion valve is other than 100 °F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

- 1 psi = 0.07 bar
- $\frac{5}{9}(t_1 \text{ °F} - 32) = t_2 \text{ °C}$
- 1 TR = 3.5 kW

The table values refer to evaporator capacity and are given as a function of:
 - evaporating temperature t_e ,
 - pressure drop Δp across the valve.

Capacities are based on:
 - liquid temperature $t_l = 100 \text{ °F}$ ahead of the expansion valve,
 - superheat $t_s = 7 \text{ °F}$.
 For each additional 10 °F of superheat, the table capacities must be reduced by 2%.

Correction factors for liquid temperature t_l

t_l [°F]	80	90	100	110	120
Factor	1.10	1.05	1.00	0.95	0.90

When liquid temperature t_l ahead of the expansion valve is other than 100 °F , adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

- 1 psi = 0.07 bar
- $\frac{5}{9}(t_1^\circ\text{F} - 32) = t_2^\circ\text{C}$
- 1 TR = 3.5 kW

The table values refer to hot gas capacity and are given as a function of:

- condensing temperature t_c ,
- pressure drop Δp across the valve.

Capacities are based on:

- hot gas temperature superheated 40°F above condensing temperature ($t_h = t_c + 40^\circ\text{F}$).
- For each additional 10°F of superheat above 40°F , the table capacities must be reduced by 1%.

Correction factors for t_h and t_c

t_c [$^\circ\text{F}$]	-40	-20	0	20	40	50
Factor	1.18	1.14	1.09	1.04	1	0.97

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40°F , adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40°F , adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Design / Function

1. Solder connection
5. Solder connection
2. Solder ring
4. Solder ring
3. Valve housing
6. Union nut
7. Armature tube
8. Return spring
9. Armature
10. Support ring
11. Pilot plate (servo)
12. Seat plate (servo)
13. Piston (servo)

Direct operated

Servo operated

Direct operated

EVU 1 is direct operated. The valve opens directly for full flow when the armature (9) moves up into the magnetic field of the coil.

This means that the valve can operate at 0 bar differential pressure. Thus, inlet pressure and spring force act to close the valve when the coil is currentless.

Servo operated

EVU 2 - 8 are servo operated piston solenoid valves. The servo piston principle results in a fast operating and compact valve that is able to open against a high differential pressure. The valve closes rather soft, because the pilot system does not fully close before the main orifice has closed. This minimizes liquid hammer.

When the coil is currentless, the main orifice, seat plate (12) and pilot orifice (on the pilot plate (11)) are closed. The pilot orifice and main orifice are held closed by the armature spring force and the differential pressure between inlet and outlet sides.

When current is applied to the coil, the armature (9) is drawn up into the magnetic field and thus lifts the pilot plate (11) and opens for the pilot orifice so that the de-energising of the servo chamber (A) starts and the pressure is relieved to the level of the outlet side. As the inlet pressure that acts on the bottom of the piston (13) now is higher than the pressure in the servo chamber (A), the piston is moved upwards and lifts both the pilot plate (11) and the seat plate (12). When the seat plate is lifted, the main orifice opens for full flow.

Therefore a minimum differential pressure of 0.02 bar is necessary to open the valve and keep it open.

When the current to the coil is switched off, the spring (8) forces the armature (9) down towards the pilot plate (11). The pressure in the servo chamber (A) increases and the piston will no longer be able to hold the seat plate (12) in lifted position, by which the main orifice closes. The armature (9) continues its downwards movement until the pilot orifice on the pilot plate (11) is fully closed.
